THE UNIVERSITY OF HONG KONG DEPARTMENT OF STATISTICS AND ACTUARIAL SCIENCE

STAT6011/7611/6111/3317 COMPUTATIONAL STATISTICS (2016 Fall)

Assignment 3, due on October 27

All numerical computation MUST be conducted in Python, and attach the Python code.

- 1. Assume $Y_i | \theta_i \sim N(\theta_i, 1)$ i.i.d. for i = 1, ..., n, and $\theta_i \sim N(0, \sigma^2)$.
 - (a) Derive the marginal (integrated) likelihood function $p(\mathbf{y}|\sigma^2)$.
 - (b) The next two parts involve the data set q1.csv with n=100. Assume a prior $p(\sigma^2) \propto 1/\sigma^2$, derive the posterior distribution of σ^2 and apply the random walk Metropolis–Hasting algorithm to draw 10,000 samples (show the trace plot).
 - (c) Derive the full conditional distributions for σ^2 and θ_i (i = 1, ..., n) and implement Gibbs sampling for all the parameters $(\sigma^2, \theta_1, ..., \theta_n)$.
- 2. Assume $Y_{ij}|\theta_i \sim N(\theta_i, 1)$ i.i.d. for i = 1, ..., n and j = 1, ..., J, and $\theta_i \sim N(0, \sigma^2)$.
 - (a) Derive the marginal (integrated) likelihood function $p(\mathbf{y}|\sigma^2)$.
 - (b) Show that the posterior distribution of σ^2 is not proper through mathematical derivations.
 - (c) The next two parts involve the data set q2.csv with n=100 and J=5. Assume a prior $p(\sigma^2) \propto 1/\sigma^2$, derive the posterior distribution of σ^2 and apply the random walk Metropolis–Hasting algorithm to draw 10,000 samples (show the trace plot).
 - (d) Derive the full conditional distributions for σ^2 and θ_i (i = 1, ..., n) and implement Gibbs sampling for all the parameters $(\sigma^2, \theta_1, ..., \theta_n)$.
- 3. Consider linear regression: $\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \boldsymbol{\epsilon}$, where \mathbf{y} is an $n \times 1$ vector of outcomes, \mathbf{X} is an $n \times k$ matrix of covariates, and $\boldsymbol{\epsilon}$ is an $n \times 1$ vector of i.i.d. $N(0, \sigma^2)$ random errors. Assign a joint prior distribution of $p(\boldsymbol{\beta}, \sigma^2) \sim \sigma^{-2}$. Follow the notation of the lecture notes "Bayes Review Examples" for all derivations.
 - (a) Derive the joint posterior distribution of (β, σ^2) .
 - (b) Derive the marginal posterior distributions of β and σ^2 , and compute their respective posterior means.
